

Procedure to run perl script:

unix:

- 1.configure your apache server to run perl scripts ending with .pl or .cgi
- 2.Place your perl scripts in the following path /var/lib/cgi-bin/
- 3.Give permissions for perl file using chmod 777 command
- 4.Finally open browser and type: localhost/cgi-bin/prg_name.pl or cgi

windows:

- 1.install xampp in your system
- 2.in perl file replce #!/usr/bin/perl by C:\xampp\perl\bin\perl.exe
- 3.place your perl file in C:\xampp\cgi-bin\

1 A. PROGRAM TO DISPLAY THE VARIOUS SERVER INFORMATION LIKE –
SERVER NAME, SERVER SOFTWARE, SERVER PROTOCOL, CGI-
REVISION ETC.

HTML FILE:

```
<html>
<head><title>SERVER INFORMATION!</title></head>
<body>
<h1>SERVER INFORMATION</h1>
<hr>
<form action="http://localhost/cgi-bin/serinfo.pl" method="get">
<input type="submit" value="submit form">
</form>
<hr>
</body>
</html>
```

PERL SCRIPT:

```
#!/usr/bin/perl
print "content-type: text/html", "\n\n";
print "<HTML>", "\n";
print "<HEAD><TITLE>ABOUT THIS SERVER</TITLE></HEAD>", "\n";
print "<BODY><H1>ABOUT THIS SERVER</H1>", "\n";
print "<HR><PRE>";
print "server name: ", $ENV{'SERVER_NAME'}, "<br>", "\n";
print "Running on the port: ", $ENV{'SERVER_PORT'}, "<br>", "\n";
print "Server software:
", $ENV{'SERVER_SOFTWARE'}, "<br>", "\n";
print "Server protocol:
", $ENV{'SERVER_PROTOCOL'}, "<br>", "\n";
print "CGI VERSION:
", $ENV{'GATEWAY_INTERFACE'}, "<br>", "\n";
print "root document:
", $ENV{'DOCUMENT_ROOT'}, "<br>", "\n";
print "<HR></PRE>", "\n";
```

INTENET PROGRAMING LAB

```
print "</BODY></HTML>", "\n";  
exit(0);
```

OUTPUT:

1 B. PROGRAM TO ACCEPT UNIX COMMAND FROM HTML FORM AND TO DISPLAY THE OUTPUT OF THE COMMAND EXECUTED.

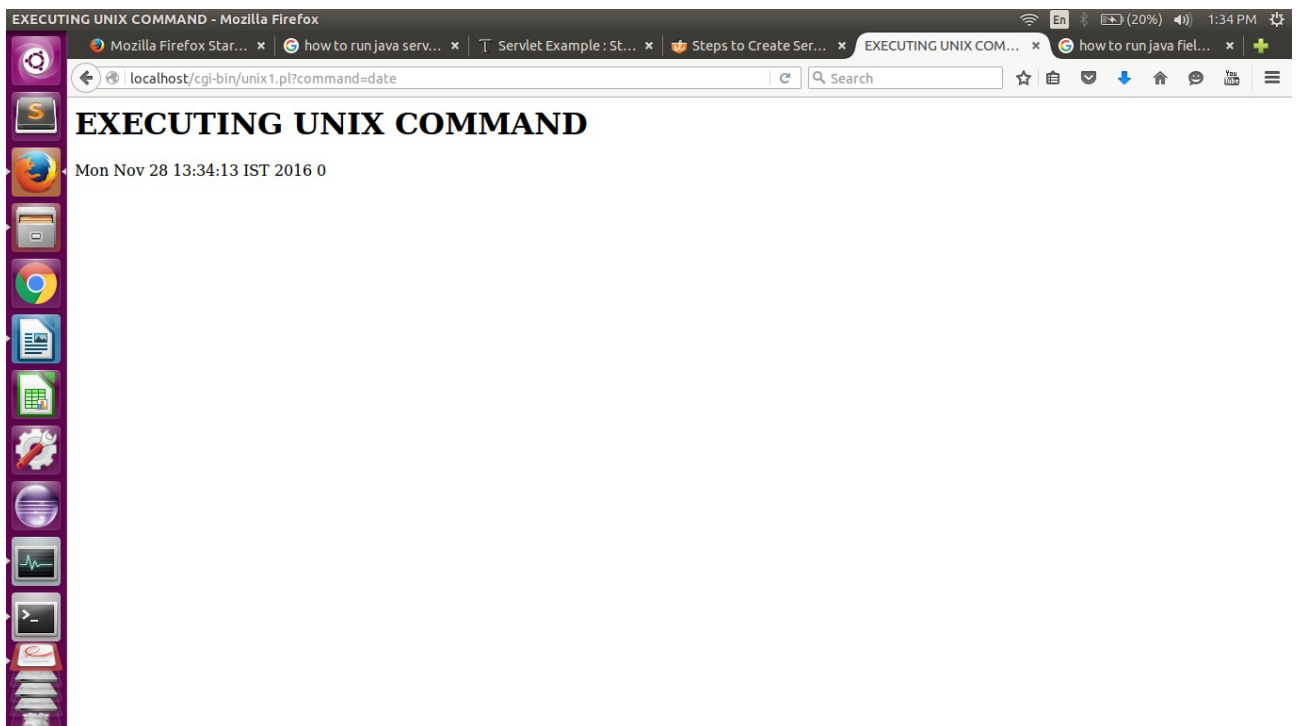

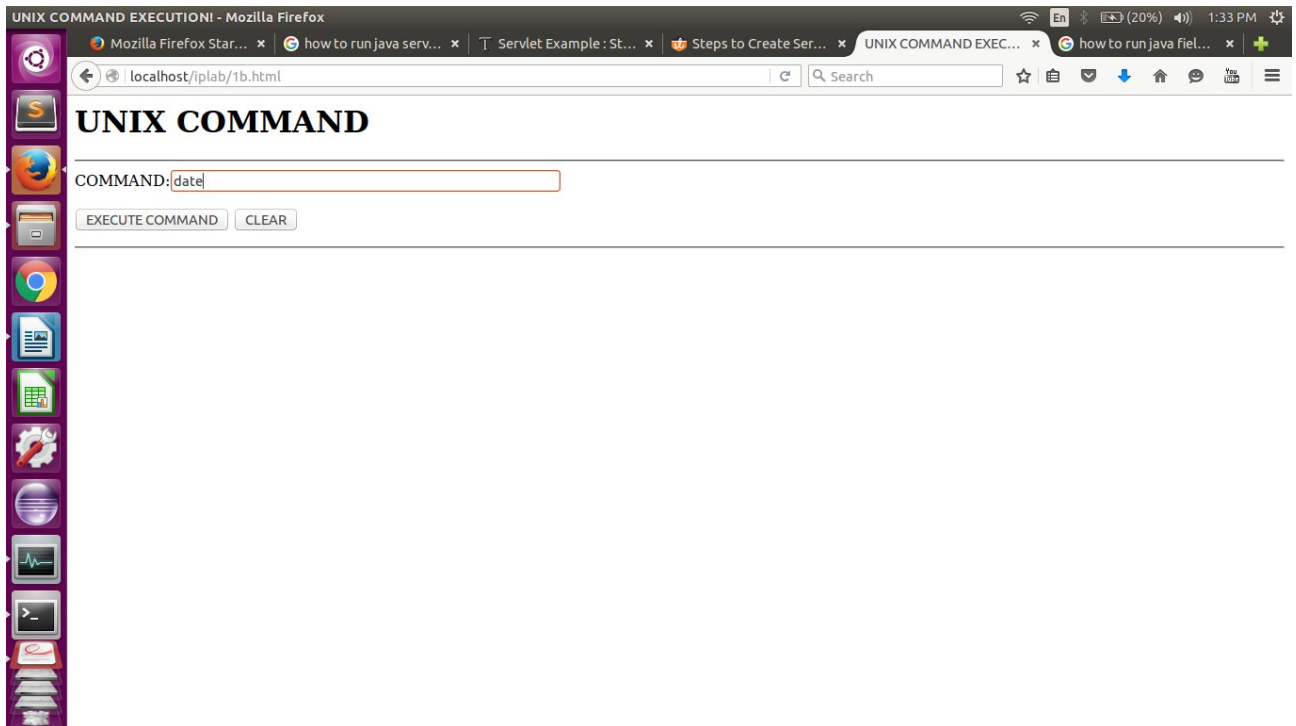

HTML FILE:

```
<html>
<head><title>UNIX COMMAND EXECUTION!</title></head>
<body>
<h1>UNIX COMMAND</h1>
<hr>
<form action="/cgi-bin/unix1.pl" method="get">
COMMAND:<input type="text" name="command" size=40>
<p>
<input type="submit" value="EXECUTE COMMAND">
<input type="reset" value="CLEAR">
</form>
<hr></body></html>
```

PERL FILE:

```
#!/usr/bin/perl
print "content-type: text/html", "\n\n";
print "<HTML>", "\n";
print "<HEAD><TITLE>EXECUTING UNIX COMMAND</TITLE></HEAD>", "\n";
print "<BODY><H1>EXECUTING UNIX COMMAND</H1>", "\n";
$query_string=$ENV{'QUERY_STRING'};
($field_name,$command)=split(/=,$query_string);
$com=system($command);
if($com==-1)
{
print "command not found! error";
}
else
{
print $com;
}
print "</body></html>";
exit(0);
```

OUTPUT:

2 A. PROGRAM TO ACCEPT THE USER NAME AND DISPLAY A GREETING MESSAGE.

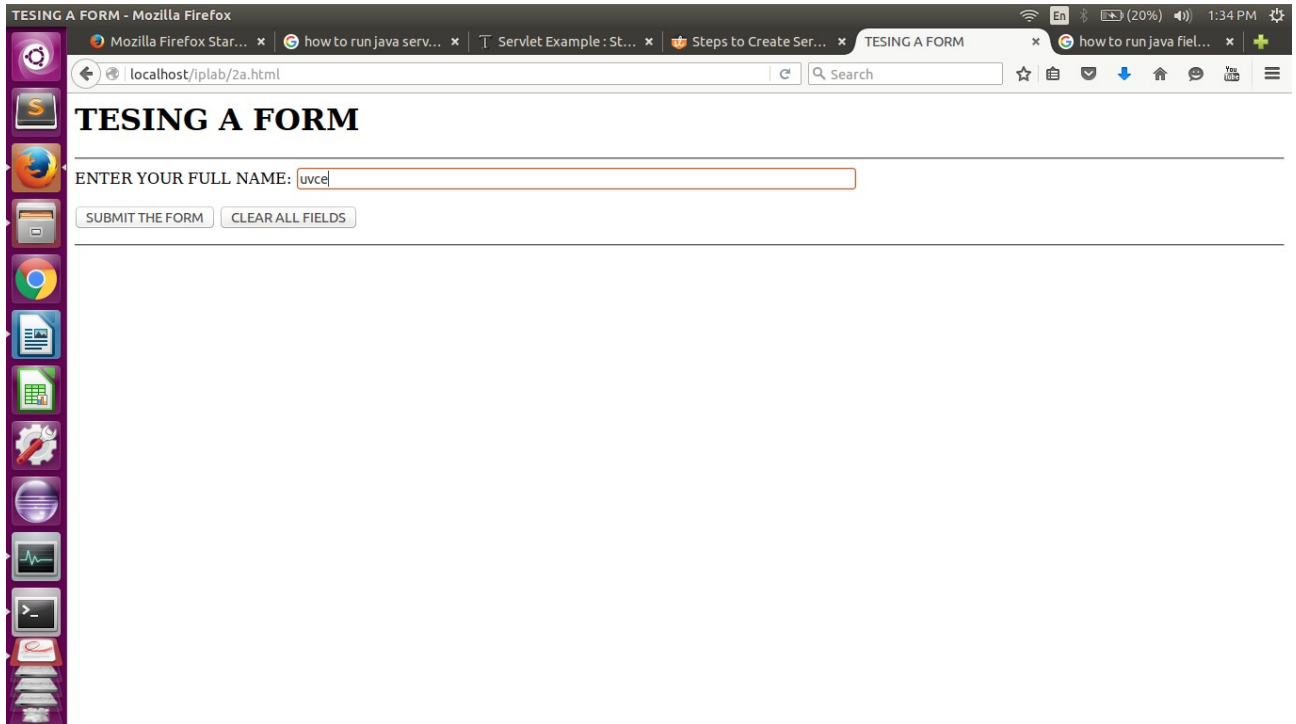

HTML FILE:

```
<HTML>
<HEAD><TITLE>TESING A FORM</TITLE></HEAD>
<BODY>
<H1>TESING A FORM</H1>

OUTPUT:

Six Steps to Running Your First Servlet:

After installing Tomcat Server on your machine follow the below mentioned steps :

1. Create directory structure for your application.
2. Create a Servlet
3. Compile the Servlet
4. Create Deployment Descriptor for your application
5. Start the server and run the programs

1) Create a directory structures

- As you can see that the servlet class file must be in the classes folder. The web.xml file must be under the WEB-INF folder.

2) Create a Servlet

Write code in a notepad file and save it as **MyServlet.java** anywhere on your PC. Compile it(explained in next step) from there and paste the class file into **WEB-INF/classes/** directory that you have to create inside **Tomcat/webapps** directory.

3) Compile the Servlet

To compile a Servlet a JAR file is required. Different servers require different JAR files. In Apache Tomcat server `servlet-api.jar` file is required to compile a servlet class.

Ex: `javac -cp /usr/share/tomcat7/lib/servlet-api.jar Example.java`

4) Create Deployment Descriptor

Deployment Descriptor(DD) is an XML document that is used by Web Container to run Servlets and JSP pages.

- Mapping URL to Servlet class.
- Initializing parameters.

<web-app> represents the whole application.

<servlet> is sub element of **<web-app>** and represents the servlet.

<servlet-name> is sub element of **<servlet>** represents the name of the servlet.

<servlet-class> is sub element of **<servlet>** represents the class of the servlet.

<servlet-mapping> is sub element of **<web-app>**. It is used to map the servlet.

<url-pattern> is sub element of **<servlet-mapping>**. This pattern is used at client side to invoke the servlet.

5) Call Your Servlet from a Web Browser

You are ready to call your servlet from a web browser. By default, Tomcat runs on port 8080 in webapps.

`http://localhost:8080/class-file-name`

10A) PROGRAM TO ACCEPT USER NAME AND DISPLAY A GREETING MESSAGE.

HTML FILE:

```
<html>
<body>
<form action="http://localhost:8080/servlet/Greet" method=get>
<table>
<tr>
<td><b>Enter Name: </b></td>
<td><input type=textBox name="user"></td>
</tr>
</table>
<input type=submit value="Submit">
</form>
</body>
</html>
```

JAVA FILE:

```
import java.io.*;
import javax.servlet.*;
import javax.servlet.http.*;
public class Greet extends HttpServlet
